

Name: Ray Emanuele P. Untal

Laboratory 9: One-Page Website Creation & Deployment using Replit

Initial Prompt

Act as a professional web developer. Create a modern, one-page personal portfolio using HTML and standard CSS. Implement a minimalist, light, glassmorphism theme with gradients for color. Use an avatar image for my profile. Divide the page into different sections: Education, Skills, and Projects & Experience. This is my portfolio:

Name: Ray Emanuele P. Untal

Email: runtal@addu.edu.ph

GitHub: <https://github.com/RayEmanueleUntal>

Education:

Ateneo de Davao University (Undergraduate)

BS in Computer Science (Current)

President's Lister (Consistent since 1st Year, 2nd Sem)

Dean's Lister (1st Year, 1st Sem)

DOST-SEI Scholar

Skills:

Languages: Python, C++, Java, JavaScript, TypeScript

Web & Backend: Next.js, NestJS, React Native, HTML/CSS, Eel, Drizzle ORM, REST APIs

Cloud & Database: Clerk Auth, Neon (PostgreSQL), Vercel, PythonAnywhere, Git/GitHub

Core CS: Data Structures and Algorithms (DSA), Problem-Solving, Analytical Thinking

Design: UI Design (Infographics, PPTs, Digital Design and Illustrations), Attention to Detail

Projects & Experience:

Calorie & Protein Tracker: Full-stack app that tracks user's daily calorie and protein intake. It uses the following tools: Next.js, TS, Drizzle, Neon, Clerk Auth, and a custom API for Siri Voice Support (Shortcuts)

Palanca (Graduation) Website: Deployed via GitHub Pages and PythonAnywhere; it uses JS/HTML/CSS with a Python backend for automated emailing. The website is used for sending messages to the graduates.

QR-Based Attendance Tracker: Desktop application built with Python and Eel. It uses QR technology to read and track user attendance. It uses SQLite for its database. The project is used by the library of my high school.

AdDU Merch Hub: Centralized marketplace platform for university organizations built using Next.js.

Self-Regulated Learning App: Mobile To-Do List (with other SRL Features) application developed using React Native.

LeetCode Proficiency: Solved 400+ problems; ranked in the top 13.76% globally.

Refinement Prompts and Changes

Prompt 1

Update the logo/title in the header from 'REPU.' to my full name 'Ray Emanuele'. Use a slightly bolder font weight for 'Ray' and a lighter weight for 'Emanuele' to give it a modern, designer feel. Also, ensure it links back to the top of the page.

Prompt 2

The top margin or padding for the Hero section is a bit too large, pushing the content too far down the page. Please reduce the top spacing to center the Hero content more vertically. Also, ensure the Hero section takes up the full viewport height (100vh), but with the text and avatar perfectly centered so it looks balanced on both desktop and mobile.

Prompt 3

The 'Scroll' button is currently hidden too far down the page, making it a bit counterintuitive. Please move it into the Hero section so it is visible immediately without scrolling. Position it clearly at the bottom of the hero page.

Final Output

Final Reflection

For this laboratory assignment, I was tasked with creating a one-page website using Replit. I chose to build a Personal Portfolio to showcase my background, education, technical skills, and projects. By the end of this activity, I successfully generated, refined, and published a live version of my portfolio.

What worked well?

Initially, I prompted Replit AI to generate a website with a specific aesthetic: a modern, minimalist light theme using glassmorphism and gradients. The AI was highly successful at translating these concepts into a functional React-based structure. It correctly organized my data, including my education at Ateneo de Davao and my various software projects, into a clean, professional layout on the first try.

What needed manual fixing?

While AI-assisted prompting was successful for the bulk of the work, it wasn't always precise enough for fine-tuning. For example, the vertical spacing (padding/margins) in the Hero section felt unbalanced, and some elements were placed "below the fold," making them hard to find. While I could have continued prompting, I found it more efficient to manually edit the source files. I directly adjusted the CSS properties to ensure the layout was pixel-perfect and the user experience felt intuitive.

What did you learn about prompting?

I learned that while AI is an incredibly powerful tool for rapid prototyping and generating boilerplate code, human direction is still essential. Successful web development in the 21st century involves Iterative Development: starting with a structured AI prompt and using technical knowledge to refine the output. I realized that the best results come from a hybrid approach: using AI for the heavy lifting and manual coding for the specific, nuanced details that make a project truly stand out.
